MONTHLY MONITOR

Prepared by

Basanta K Pradhan & Sangeeta Chakravarty

February 2011

Industrial growth fluctuates

WPI inflation is getting sticky

Marginal decline in Consumer Price inflation

Rupee depreciated marginally

Exchange Reserves up

Highlights

The annual growth of Index of Industrial Production for the month of January 2011 has come out at 3.7 percent versus 1.6 percent in December 2010, and is largely explained by a sharp fall of 18.6 percent in the growth of capital goods. In contrast, the capital goods increased at a whopping 63.0 percent in July 2010. The industrial activity is cooling down after many months of high growth.

The year on year WPI inflation was 8.31 percent for February as compared to 8.23 percent for January, 2011. The inflation has almost become sticky at around 8.5 percent since August 2010. The rapid growth of GDP, the slow growth of agriculture and the low base effect explains this high inflation for the last many months. The recent surge in oil prices also has started putting pressure on inflation. The withering of the base effect and the continuing monetary tightening of RBI though at a slower pace are putting some downward pressure on inflation.

There is a marginal reversal in the annual growth in all India Consumer Price Index Number for Industrial Workers which went down to 9.30 percent in January 2011 from 9.47 percent in December, 2010.

The continuous flow of FIIs into Indian stock market and the strong growth of Indian economy in recent months have assisted in strengthening the Indian rupee. However, the exchange rate depreciated marginally to 45.47 per dollar in February 2011 as continued inflation is putting a downward pressure.

Foreign exchange reserves went up almost progressively from US\$ 273.72 billion in May 28, 2010 to and US\$ 302.59 billion on March 4, 2011. This is a substantial progress from months back when reserves reached below 250 billion mark, though it is away from the peak of 314.61 billion of May 2008. These impressive figures clearly show the foreign investors' confidence about India's long term growth prospects.

*Exports grows up sharply
while imports picks up
momentum*

India's exports after growing at a very high pace in past few months and it grew at a high 49.8 percent in February, mainly due to the recovery of growth in USA and Asia and the newer markets of Latin America and Africa. The imports increased by 21 percent in February 2011 as against a contraction of nearly 11 percent in December 2010. This rebound in growth is mainly due to non-oil imports showing pick up in internal demand. Though the trade deficit in January 2011 was down to US\$ 7.9 billion from 9.7 billion a year ago, it is up again at US\$ 8.1 billion in February 2011. The deficit is a concern though it is increasing at a slower rate due to the lower growth of imports.

IEG FORECAST

Variables	Latest Information available	Forecast for next three months
Inflation rate (WPI)	8.31% in February 2011	7.97%, 7.52%, 6.56%
Inflation rate (CPI)	9.3% in January 2011	8.98%, 8.84%, 8.70%
Growth rate of IIP	3.7% in January 2011	5.50%, 3.18% , 2.01%
Growth rate of M3	16.5% on February 25, 2011	16.68 %,16.70%,16.71%
Re/\$ exchange rate	45.18 monthly average till March 17, 2011	45.24, 45.14, 44.98
Forex reserves	US\$ 302.59 billion on March 4, 2011	\$305.79, \$308.13, \$310.23
FII inflows (Net)	US\$ 641.32 million monthly average till March 17, 2011	Inflows to pick up momentum in the next three months
Growth rate of exports	49.8% in February 2011	Average of 21% for next three months
Growth rate of imports	21% in February 2011	Average of 15.9% for next three months

WPI inflation becoming sticky

Inflation

The year on year WPI inflation was 8.31 percent for February as compared to 8.23 percent for January, 2011, 8.43 percent for December, 2010, 7.48 percent for November, 8.58 percent for October, 8.62 percent for September and 8.51 percent for August 2010, based on the new series. The new WPI index tracks 676 commodities in contrast to the old index which was based on 435 commodities. The rapid growth of GDP, the slow growth of agriculture and the low base effect explains this high inflation for the last many months.

In February 2011, the primary articles index with a weight of 20.12 percent fell by 2.9 percent while the index for fuel, power, light and lubricants with a weight 14.91 percent was up by 0.7 percent, and the index for the principal sector, the manufacturing products with a weight of 64.97 percent was up by 1.3 percent over the previous month. The price for 'Food Articles' group fell by a sharp 5.2 percent where as prices for manufacturing including the prices of manufactured food products rose.

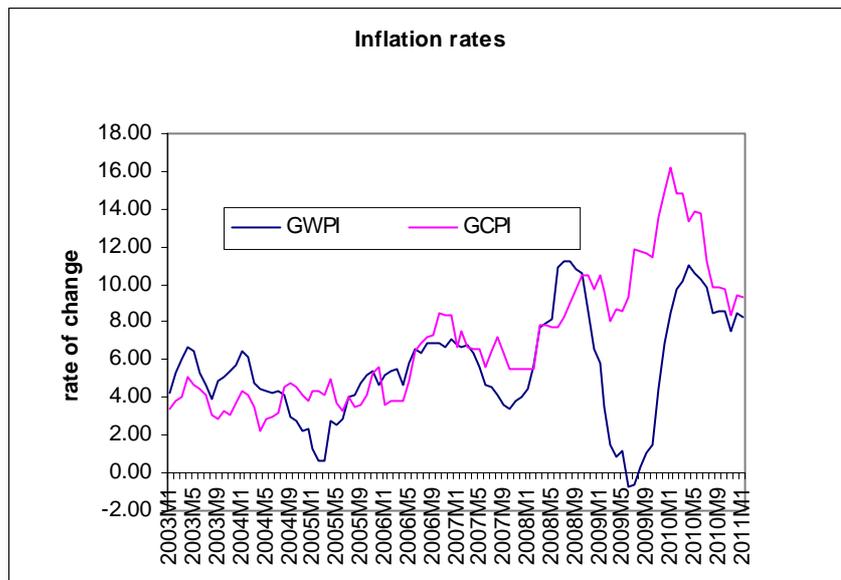

Though accelerated food price increase, the increase in input prices for manufacturing, the increasing trend of crude prices and the short-term falling trend of rupee were putting an upward pressure on inflation, the withering of the base effect, the continuing monetary tightening of RBI though at a slower pace and the other government measures were putting a downward pressure on inflation. Recently the food prices have started cooling down though the manufactured goods inflation is up indicating the emergence of a demand-pull inflation. The middle east crisis has caused a sharp rise in oil prices. In medium term, due to the natural disaster in Japan, the substitution of nuclear energy with other sources will put pressure on prices of fossil fuel sectors, though, in the short run, commodity prices may cool down. On the positive side, the area under Rabi crops has gone up. On balance, the inflation is likely to marginally go below the psychological 8 percent mark in the next month.

CPI declines marginally

The annual growth in all India Consumer Price Index Number for Industrial Workers came down to 9.30 percent in January 2011 from 9.47 percent in December, 2010. The annual growth in Food Index is up at 10.22 percent in January, 2011 as compared to 7.98 percent in the previous month. The annual growth in all India Consumer Price Index Number for Industrial Workers came went up to 9.47 percent in December from 8.33 percent in November, 2010. The much sensitive food inflation went up steeply to 7.98 percent from 5.35 percent in the same period. The CPI inflation was 8.33 percent in November, 9.88 percent in August 2010, 11.25 percent in July, 13.73 percent in June, 13.91 percent in May and 13.33 percent in April, 2010. The gap between inflation rates as measured by the wholesale price index and as measured by consumer price index is explained by the higher weightage given to primary products and food items in CPI, whereas WPI covers a wider range of the outputs of various commodities. It is forecasted that the growth rates in CPI will remain around the same in the next three months as in November, mainly, due to the rise in food prices.

Forecast:

The WPI inflation forecasts are 7.97 %, 7.52 %, and 6.56 % for March April and May 2011 respectively. The CPI inflation forecasts are 8.98%, 8.84% and 8.70% for February ,March and April 2011 respectively.

Industrial Production

The annual growth of Index of Industrial Production for the month of January 2011 has come out at 3.7 percent versus 1.6 percent in December 2010, and is largely explained by a high fall of 18.6 percent in the growth of capital goods. The IIP grew at 2.7 percent in November, 10.8 percent in October, 4.4 percent in September, 5.6 percent in August, 13.8 percent in July, 7.1 percent in June, at 11.6 percent in May, 17.6 percent in April and at 13.5 percent in March 2010. The index recorded high growths of 17.6 per cent in December 2009, 16.7 per cent in January 2010 and 15.1 percent in February 2010.

The uptrend in the industrial activity is getting consolidated. The revival in demand supported by the low base for the year 2009 is able to deliver this continuous positive growth. However, the pace of growth is seen to be tapering off as the low-base effect wears off and the impact of rate hikes and withdrawal of stimulus picks up. The global recovery is also slow. Recently, the IIP growth has become extremely volatile. The growth in advance tax collection and exports is a positive sign for industrial growth. The middle east crisis and the natural disaster in Japan are worrying signs in short run. The IIP growth is likely to be around percent in next month.

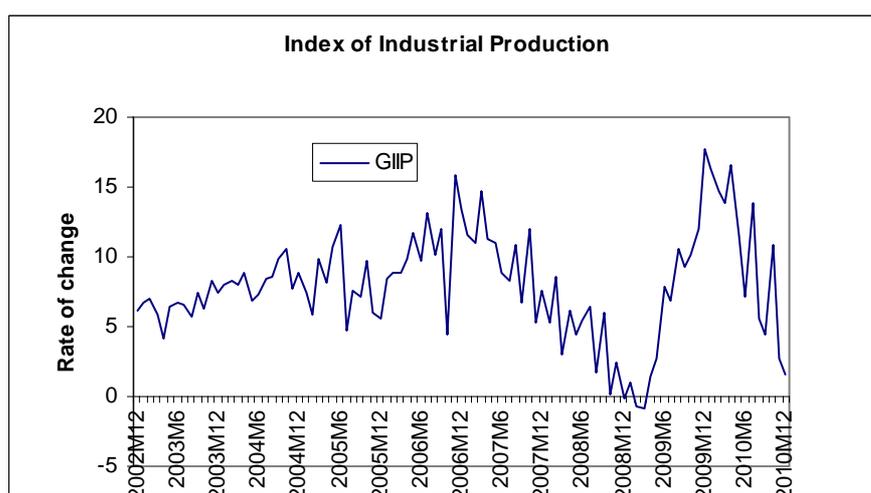

Industrial growth is up

The Mining, Manufacturing and Electricity sectors for the month of January 2011 grew at 1.6 percent, 3.3 percent and 10.5 percent, respectively, as compared to the same month in the previous year. Industry groups like 'Jute and other vegetable fibre Textiles (except cotton)', 'Other Manufacturing Industries' and 'Leather and Leather & Fur Products' have increased at very high rates of 772.6 percent, 39.0 percent and 27.0 percent, respectively, and have helped the IIP to maintain its positive trend. The mining sector may not pick up in the short to medium run as environmental issues may take time to resolve. Similarly, land acquisition issues also affecting the industry sector as whole. Even though the domestic demand remains strong and the uncertainty associated with the global demand is reducing, unless the supply constraints are progressively reduced the growth may retard in the Manufacturing sector. The crisis in the middle east is adding to the problem of high oil prices.

In January 2011, the annual growth rates in Basic goods and in Intermediate goods are 7.6 percent and 7.9 percent, where as Capital goods declined by 18.6 percent. The negative Capital goods growth is not a good sign for sustaining the over all growth rate in the economy especially when the output gap is closing up in the economy. The Consumer goods rose at 11.3 percent while the Consumer durables grew at 23.3 percent and Consumer non-durables increased at a high 6.9 percent.

Forecast:

Based on the available information we forecast the IIP growth rate for the next three months to be 5.50%, 3.18% and 2.01% for February, March and April 2011

Money and Credit

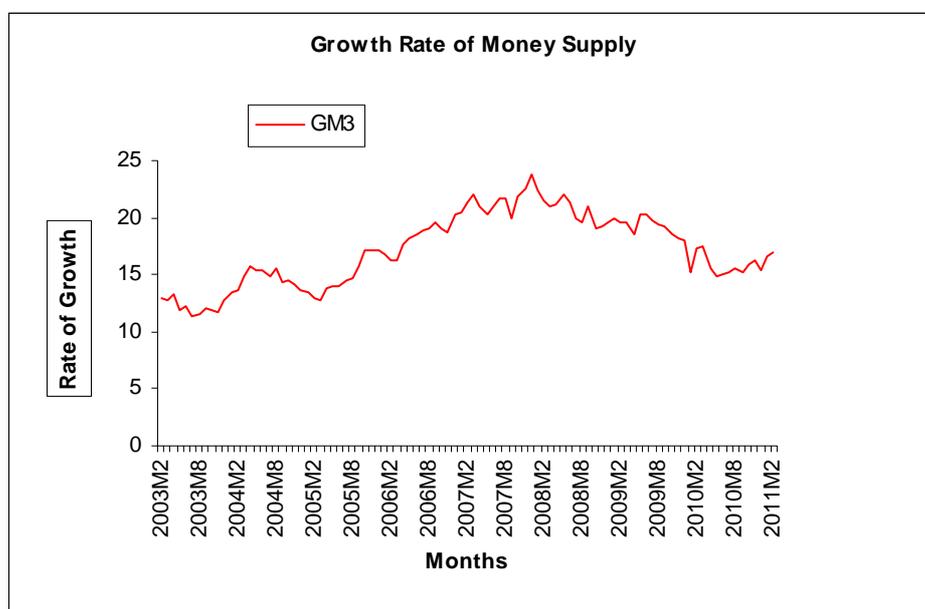

As on February 25, 2011, Money supply grew annually at 16.5 percent as against 17.4 percent in the previous year. On January 14, 2011, it grew at 16.6 percent. In 2010, it grew at 15.0 percent in December 17, 16.2 percent in

Money supply up at 16.5 percent

November 19, 15.8 percent in October 8, and 15.6 percent in September 10. Though the monetary tightening of RBI has reduced the liquidity in the system, the picking up of credit off take has helped the money supply to increase. The expansion in money supply is contributed by the net credit to the Government increasing at 15.9 percent and credit to commercial sector at 22 percent. Though food credit has gone up in February the overall credit uptake has moderated. The FIIs have again started bringing money to India reaffirming their faith into its growth prospects. The government has increased the FII limits recently. The money supply is forecasted to grow at a little less than 17 percent for the next three months.

Forecast:

The forecast for the growth rate of money supply (M3) is 16.68 %, 16.70% and 16.71% for March, April and May 2011

Interest rates

As the positive signs of the revival of the economy is sustaining itself and inflation is not coming down fast enough from a very high level, the RBI is slowly withdrawing from its low policy rates regime and the trend is going to continue, even though at a slower pace, given the inflationary pressure in the economy. The RBI has already raised its repo rate by 200 basic points since March 2010 to 6.75 percent. The reverse repo rate is now 5.75 percent. The rise in prices, though has started cooling down, has already spilled over from supply to demand side. The inflation rates (WPI) has started coming down from the double digits, however, the inflationary expectations continues to be high as the oil prices has gone up sharply due to the middle east crisis. The growth momentum in the economy backed by domestic demand is putting pressure on prices. The prime lending rates are also seeing upward revision both due to the continuous upward revision of policy rates, upward revision of deposit rates and

Interest rates are in upward spiral

Rupee depreciate marginally

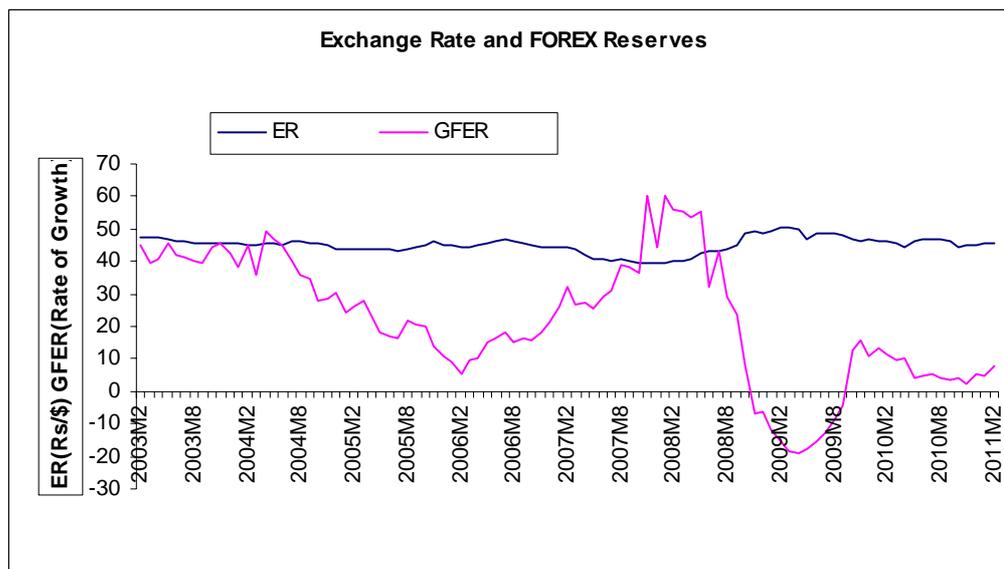

the uncertainty in the global scenario. In the medium term, increases in prices and GDP will increase the demand for money while monetary tightening by RBI will reduce the supply putting further pressure on the market interest rates. The corporates may increase their borrowings from outside the country as interest rates are low there, which may have a softening effect on the domestic interest rates. On balance, we would like to believe that the market interest rates may increase further.

Exchange rate

The continuous flow of FIIs into Indian stock market and the strong growth of Indian economy in recent months have assisted in strengthening the Indian rupee. The rupee hit a five month high on the 4th October 2010 at 44.24 rupees per dollar. Rupee appreciated 12.9 percent during the year 2009-10 as against a depreciation of 25.5 percent in the previous year. This appreciation was mainly due to economic recovery. Foreign institutional investors have been returning to Indian stock exchanges due to the foreign investors' confidence about India's long term growth prospects. However, the expected widening of trade deficit may put pressure on rupee. The rupee was 46.55 per dollar in August, 46.85 in July and 46.56 in June 2010. The rupee has depreciated to these levels with respect to the previous couple of months, though it appreciated in comparison with the June 2009 figure of 47.67, mainly due to the drying of flows to the Indian stock market due to the Euro zone crisis. The exchange rate was 45.47 in February and 45.34 in January 2011, 45.21 in December, 44.94 in November and 44.45 in October 2010.

Forecast:

In coming months, exchange rate is expected to be around Rs/\$45.24 , Rs/\$45.14 and Rs/\$44.98 for April, May and June 2011

Foreign Exchange Reserves

Foreign exchange reserves stood at US\$ 302.59 billion on March 4, US\$ 299.39 billion on January 21, 2011. It went up progressively from US\$ 273.72 billion in May 28, 2010 to US\$ 297.99 billion on November 19 and US\$ 295.03 billion on December 24, 2010. This is a substantial progress from a few months back when reserves reached below 250 billion mark, though it is away from the peak of 314.61 billion of May 2008. The rise in reserves is mainly due to inflow of foreign investment into Indian market. The rise in stock market indices attracted huge FII inflows. The high interest rate differentials between India and the rest of the world, which is also likely to continue for sometime, must have helped in this increase. However, due to the middle east crisis and the predicted higher growth rate for world economy, the high oil import prices could restrain the accumulation of reserves. The increasing outflow of Indian FDI to other countries is also restraining the accumulation. On balance, we forecast higher reserves for the next three months.

Forecast:

Forex reserves expected to be \$305.79 billions, \$308.13 billions and \$310.23 billions in April May and June 2011

Foreign Institutional Investment

The foreign institutional investments (FIIs) in Indian market were a negative US\$ -721.13 million in February 2011. Whereas the FIIs were US\$ 710 million in December, US\$ 4784 million in November, US\$ 5468 million in October, US\$ 4262.60 million in September, US\$ 3082.75 million in August, US\$ 5285.33 million in July and US\$ 2433.99 million in June 2010. These figures clearly show the foreign investors' confidence about India's long term growth story though in the last three months they are quite low. The expected medium term appreciation of rupee and the prospects of returns are making Indian economy attractive for FII inflows in medium to long term.

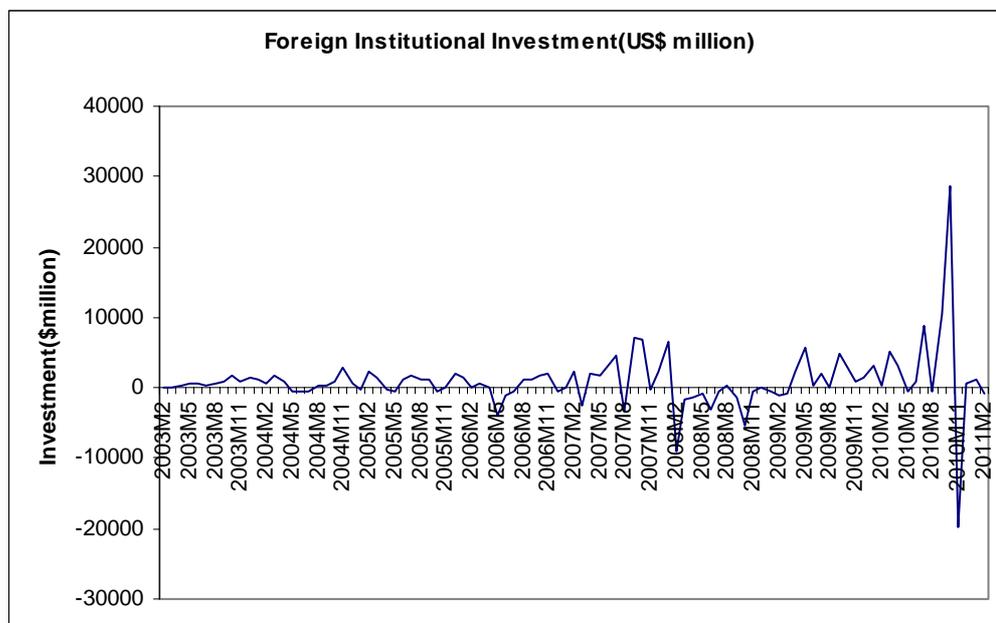

The FII flows were as low as US\$ -1504.87 million in May mainly due to Euro zone crisis, US\$ 2783.32 million in April 2010, US\$ 5206 million in March and only US\$ 230 million in February 2010. For 2009-10, the cumulative FIIs were 29047 million as against -15017 million for 2008-09. The revival in major global economies along with the improvement in Indian share markets have helped in reversing the negative trend of foreign institutional investments of the crisis period of the economy. After registering a huge fall during the crisis, the 30 share index of Bombay Stock exchange Sensex went up above the high 20,000 mark though in last couple of months, the index is around 18000 due to the high oil prices. The high inflation indicating further rise in interest rates, expected falling rate of profit due to increase in input prices are also weighing down the Sensex. The natural disaster in Japan may also lower the FIIs flows to

FIIs flows are again looking up

India. It is forecasted that the flows are likely to be on the lower side like the last two months, for the next three months.

Forecast:

Inflows to pick up momentum in the next three months

Exports and Imports

The revival in the external demand following the recovery in industrialized nations and large base effect has resulted in this sustained positive growth in exports. The exports to USA, Asia and the newer markets of Africa have helped sustaining the high growth. The export growth was at 49.8 percent in February where as it was 32.4 percent in January 2011. The exports rose at a healthy 31.4 percent during April 2010-February 2011 .The export growth was at 36.4 percent in December at US\$ 22.5 billion where as it was 26.5 percent in November at US\$ 18.9 billion. It is expected that the exports would grow at an average of 21 percent in next three month. Higher inflations at home may not be a good sign for export growth but the encouraging scenario in USA is a positive sign.

Imports grew by 21 percent in February as against a rise of 13.1 percent in January, 2011. It fell by 11.1 percent in December, and grew at 11.2 percent in November, 6.8 percent in October, 26.1 percent in September, 32.6 percent in August, at 34.3 percent in July, at 23 percent in June and at 38.5 per cent in May 2010. In January 2011, oil imports fell by 7.8 percent over the corresponding period last year, while non-oil imports grew at 23.8 percent. Non-oil imports during the April 2010 – January 2011 are 19.2 per cent higher than the level of such imports in the same period last year while the figure for

Exports up sharply at 49.8 percent

Imports grows at a healthy 21

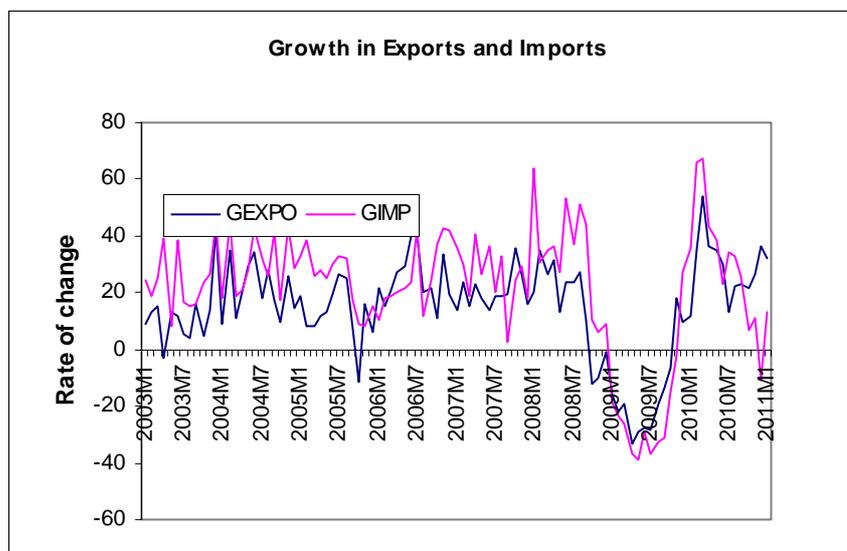

percent

oil imports is 13.9 percent. The substantive rise in non-oil imports during last ten months shows the demand side is stabilizing at a higher level due to the rapid recovery process in the domestic economy.

Though the trade deficit in January 2011 was down to US\$ 7.9 billion from 9.7 billion a year ago, it is up again at US\$ 8.1 billion in February 2011. The trade deficit for April - January, 2010-11 was US\$ 88.97 billion versus US\$ 89.83 billion, for the same period, a year ago. The deficit is a concern though it is increasing at a slower rate due to the lower growth of imports. The exports are forecasted to increase at a faster pace than the imports for the next three months bringing down the growth in deficits further. The impact of the current disaster in Japan will be minimal in the short run on India's foreign trade sector.

Forecast:

Exports growths and import growths are forecasted as average of 21% and 15.9% for the next three months.

Note:

The forecasts that are presented in this document are based on the time series model namely Vector Autoregression model (VAR). Each variable has an independent model. This is based on monthly data from April 1993 onwards upto latest information available. The lag length for each VAR model is chosen with the help of Akaike Information Criterion (AIC). We estimate and forecast the VAR models by using Micro FIT software. More details is available at "A Short-term Time Series Forecasting Model for Indian Economy" available on our institute website at http://www.iegindia.org/dis_bhanu_72.pdf

The views expressed in this document are authors alone and not to be attributed to the institute to which the authors belong.
